Laura Rainfall Forecast and Excessive Rainfall Outlooks

2-Day Rainfall Forecast Through Early Sunday

Flash Flooding Risk Friday – Saturday

NOW

Local point maximum rainfall may be higher than shown. See the NHC public advisories for the latest tropical cyclone information.
Flood Hazard Messages
(associated with Tropical Depression Laura)

- Saltwater flooding will continue on the coastal rivers of Louisiana where storm surge pushed over land and up the rivers. As freshwater flows into these regions, flooding will continue into next week.

- Today into Saturday, as Laura’s remnants continue to move east-northeast, additional rainfall of 1 to 3 inches, with isolated 5 inches, is expected across portions of the mid-Mississippi, Tennessee and lower Ohio Valleys, and the Mid-Atlantic States. This rainfall will result in isolated flash and urban flooding, small streams and creeks to overflow their banks, and minor to moderate river flooding; however, widespread river flooding is not anticipated at this time.

- Rainfall bands will continue to feed up across portions of southern Louisiana, northwest Mississippi and Alabama today bringing localized rainfall amounts of 1 to 4 inches. This rainfall may lead to localized flash and urban flooding and rapid rises on small streams.

- In northern Arkansas and far southern Missouri, additional rainfall of up to 2 inches Saturday night, not associated with Laura, could result in isolated flash and urban flooding and further elevate river flooding.

Disclaimer: This graphic is intended to provide a general flash and river flood hazard outlook. It is not intended to depict coastal flood risk due to storm surge.
